Problem Statement -

Challenge

Access to legal advice is often **expensive, time-consuming, and difficult to understand**. Legal information is scattered, contracts are complex, and users struggle to identify legal risks and compliance requirements.

Objective

Develop an **AI-powered Multi-Agent Legal Aid System** that provides **legal Q&A, contract analysis, compliance checking, and case research** using **RAG** to deliver accurate, easy-to-understand, and reliable legal assistance.

Proposed Solution: AI-Powered Legal Aid Multi-Agent System

Develop an **AI-powered Multi-Agent Legal Aid System** using **IBM watsonx Orchestrate, watsonx.ai, and Granite Models**. The system leverages **RAG** to retrieve trusted legal information, analyze contracts, verify compliance, and research case laws through specialized AI agents. A user-friendly dashboard provides legal insights, document highlights, and conversational assistance, making legal information accessible while clearly stating that it is **not a substitute for professional legal advice**.

Technology Used

- **Tech Stack**
- **IBM watsonx Orchestrate** – Multi-agent workflow orchestration.
- **IBM Granite Model** (e.g., Granite 3.3 8B Instruct) – Legal reasoning, summarization, and Q&A.
- **IBM Cloud** – Secure and scalable application hosting.
- **RAG (Retrieval-Augmented Generation)** – Retrieves relevant legal documents before generating responses.
- **IBM watsonx.ai** – Model deployment, embeddings, and AI governance.
- **Vector Database (FAISS/Chroma)** – Semantic search over legal documents and case laws.
- **IBM Cloud Object Storage** – Stores legal documents and contracts.

Role of Agentic AI in the solution

Agentic AI enables the Legal Aid System to work as an intelligent assistant by coordinating specialized agents for **contract review, compliance checking, legal Q&A, and case research**. It understands user context, selects the appropriate agent, retrieves relevant legal information using **RAG**, and combines insights from multiple agents to provide accurate, personalized, and easy-to-understand legal guidance.

Novelty and Uniqueness

The proposed AI Legal Aid Multi-Agent System combines Agentic AI, RAG, and legal document intelligence into one intelligent platform.

Multi-Agent AI – Specialized agents handle contract review, compliance, legal Q&A, and case research.

RAG-Based Accuracy – Retrieves trusted legal information before generating responses.
Smart Document Analysis – Detects key clauses, obligations, and legal risks automatically.

Context-Aware Assistance – Provides personalized, easy-to-understand legal guidance.

Automated Compliance & Case Research – Checks regulations and retrieves relevant legal precedents.

Scalable & Secure – Powered by IBM watsonx.ai, watsonx Orchestrate, and Granite models.

The solution acts as an intelligent legal assistant, not just a traditional legal chatbot.

Future Scope

1. Integration with Government Legal Portals & Live Legal Databases –

The system can integrate with government legal portals and court databases to access the latest laws, regulations, notifications, and judgments in real time. This ensures users receive up-to-date and accurate legal information.

2. Multilingual & Voice-Based Legal Assistant –

Adding multilingual support and a voice-enabled assistant will make legal assistance more accessible. Users can ask legal questions, upload documents, and receive explanations in their preferred language, improving accessibility for diverse communities.
